

OnPoint — User Acceptance Testing (UAT) Script

Project: OnPoint Chrome Extension

Document Version: 1.0

Date: April 10, 2026

Sprint / Release: MVP v1.0

Prepared By: Team INH

Status: Ready for UAT

Section 1 — Onboarding Flow

ID	Description	Preconditions	Steps	Expected Results	Actual Results	Status
TC001	Validate that the OnPoint extension loads the onboarding screen on first install	Chrome browser open; extension not previously installed	1. Open Chrome and navigate to <i>chrome://extensions</i> 2. Enable Developer Mode and click "Load unpacked" 3. Select the extension/ folder 4. Click the OnPoint icon in the toolbar	Onboarding welcome screen is displayed with the OnPoint value proposition and a "Get Started" call-to-action		Pass / Fail
TC002	Validate that the onboarding flow guides the user through all setup steps	Extension installed; onboarding screen visible (TC001 passed)	1. Click "Get Started" on the welcome screen 2. Progress through each onboarding step 3. Observe step indicators and navigation controls	Each step is shown in sequence (welcome → card import → confirmation); progress indicators update correctly; user can navigate forward and back		Pass / Fail
TC003	Validate that a user can add their first credit card during onboarding	User is on the card import step of onboarding	1. Click "Add Card" or the equivalent add action 2. Enter card nickname, reward category, and cashback rate 3. Submit the card form	Card is added and displayed in the card preview list; no error messages appear		Pass / Fail
TC004	Validate that completing onboarding transitions the user to the active dashboard	At least one card added; user is on the confirmation step	1. Review the confirmation screen showing the added card(s) 2. Click "Finish" or "Start Using OnPoint" 3. Observe the resulting screen	User is taken to the main dashboard; card library shows the added card; detector status shows as active		Pass / Fail

Section 2 — Checkout Page Detection

ID	Description	Preconditions	Steps	Expected Results	Actual Results	Status
TC005	Validate that the extension detects a standard checkout page and displays the detection indicator	Extension installed and active; at least one card in wallet	1. Open extension/test-pages/checkout-sample.html in Chrome with the extension loaded 2. Wait up to 5 seconds 3. Observe the extension icon and any popup UI	Extension badge or popup indicates a checkout has been detected; no console errors		Pass / Fail
TC006	Validate that the extension does NOT trigger on a non-checkout page	Extension installed and active	1. Open extension/test-pages/non-checkout.html 2. Wait 5 seconds 3. Observe the extension icon and popup	No checkout detection indicator appears; extension remains in idle state		Pass / Fail
TC007	Validate that the extension detects a EUR-currency checkout page	Extension installed and active	1. Open extension/test-pages/checkout-sample-eur.html 2. Wait up to 5 seconds 3. Observe the extension popup	Extension detects the checkout page regardless of currency; detection indicator appears normally		Pass / Fail
TC008	Validate that the extension detects a checkout on a live Shopify-based storefront	Extension installed; internet connection available	1. Navigate to a publicly accessible Shopify store 2. Add an item to the cart and proceed to checkout 3. Wait up to 5 seconds on the checkout page	Extension detects the Shopify checkout and shows the recommendation popup or badge		Pass / Fail

Section 3 — Card Recommendation Engine

ID	Description	Preconditions	Steps	Expected Results	Actual Results	Status
TC009	Validate that a card recommendation is generated within 2 seconds of checkout detection	Extension active; at least one card in wallet; checkout-sample.html loaded	1. Open extension/test-pages/checkout-sample.html 2. Note the time when the page loads 3. Observe when the recommendation popup appears	Recommendation popup appears within 2 seconds of page load; a card name and estimated reward are displayed		Pass / Fail
TC010	Validate that the recommended card matches the highest reward	Two or more cards with different reward rates in wallet; merchant matches a	1. Add two cards — Card A (3% shopping) and Card B (1% shopping) 2. Open a shopping checkout page	Card A (3% cashback) is recommended as the top pick;		Pass / Fail

ID	Description	Preconditions	Steps	Expected Results	Actual Results	Status
	rate for the detected merchant category	known category (e.g., Shopping)	3. Observe which card is recommended as the primary pick	Card B appears as an alternative		
TC011	Validate that the recommendation popup displays the card image, name, and estimated reward amount	Checkout detected; recommendation generated	1. Open a checkout page with the extension active 2. Wait for the recommendation popup 3. Inspect the popup contents	Popup shows: card name, card image (or placeholder), and estimated cashback/reward amount for the purchase		Pass / Fail
TC012	Validate that alternative card recommendations are displayed below the primary pick	Three or more cards in wallet; checkout detected	1. Open a checkout page 2. Wait for the recommendation popup 3. Scroll or expand the alternatives section	At least one alternative card is shown below the primary recommendation with its reward estimate		Pass / Fail

Section 4 — Recommendation Display & Interaction

ID	Description	Preconditions	Steps	Expected Results	Actual Results	Status
TC013	Validate that the user can accept a card recommendation from the popup	Recommendation popup visible on a checkout page	1. Open a checkout page with the extension active 2. Wait for the recommendation popup 3. Click "Use This Card" (or equivalent accept action)	Popup acknowledges the selection; no errors; UI updates to reflect the accepted card		Pass / Fail
TC014	Validate that the user can dismiss/skip the recommendation popup	Recommendation popup visible	1. Open a checkout page with a visible recommendation popup 2. Click "Skip" or dismiss the popup (×) 3. Observe the page state	Popup closes without error; checkout page remains fully functional		Pass / Fail
TC015	Validate that the user can add a new card directly from the recommendation popup	Recommendation popup visible; card wallet has at least one card	1. Click "Add New Card" within the recommendation popup 2. Complete the add-card form 3. Submit and observe	New card is added to the wallet and appears in the alternatives section of the popup or card library		Pass / Fail
TC016	Validate that the recommendation popup does not degrade page performance	Extension active; checkout page loaded	1. Open a checkout page with the extension active 2. Open Chrome DevTools → Performance tab	Page load impact is less than 2 seconds; no layout jank observed in the performance trace		Pass / Fail

ID	Description	Preconditions	Steps	Expected Results	Actual Results	Status
			3. Record while the popup appears and is interacted with			

Section 5 — Card Management

ID	Description	Preconditions	Steps	Expected Results	Actual Results	Status
TC017	Validate that a user can manually add a new credit card to their wallet	User is on the Card Library / dashboard; onboarding completed	1. Navigate to the Card Library section 2. Click "Add Card" 3. Enter card nickname, reward category, and cashback percentage 4. Click Save	New card appears in the card list immediately; data is persisted in <code>chrome.storage.local</code>		Pass / Fail
TC018	Validate that card data persists after the browser is restarted	At least one card added to the wallet	1. Add a card to the wallet 2. Close and reopen Chrome 3. Open the OnPoint popup and navigate to Card Library	Previously added card(s) are still present in the card library after restart		Pass / Fail
TC019	Validate that a user can edit an existing card's details	At least one card in the wallet	1. Open Card Library 2. Click "Edit" on an existing card 3. Change the nickname and cashback rate 4. Click Save	Card details are updated in the library; updated values persist after popup close/reopen		Pass / Fail
TC020	Validate that a user can delete a card from their wallet	At least two cards in the wallet	1. Open Card Library 2. Click "Delete" on one card 3. Confirm the deletion prompt 4. Verify the card list	The deleted card is removed from the library and does not reappear after refresh		Pass / Fail
TC021	Validate that the user can search for a card by name in the card library	Three or more cards in the wallet with different names	1. Open Card Library 2. Type a partial card name into the search field 3. Observe the results	Only cards matching the search term are displayed; results update in real time as the user types		Pass / Fail

ID	Description	Preconditions	Steps	Expected Results	Actual Results	Status
TC022	Validate that the user can filter cards by reward category	Cards with different categories (e.g., Dining, Travel, Shopping) exist in wallet	1. Open Card Library 2. Select a category filter (e.g., "Dining") 3. Observe the filtered results	Only cards tagged with the selected category are displayed		Pass / Fail

Section 6 — Purchase Tracking (Detection Only)

ID	Description	Preconditions	Steps	Expected Results	Actual Results	Status
TC023	Validate that the extension detects a purchase completion event on a confirmation page	Extension installed and active	1. Open extension/test-pages/purchase-completion-sample.html 2. Wait up to 5 seconds 3. Observe extension popup or local storage for a purchase record	Extension detects the purchase confirmation; a purchase record (merchant, timestamp) is stored in <code>chrome.storage.local</code>		Pass / Fail
TC024	Validate that purchase records include merchant name, amount (if available), and timestamp	Purchase completion detected (TC023 passed)	1. Open Chrome DevTools → Application → Storage → <code>chrome.storage.local</code> 2. Inspect the purchase history entry created by TC023	Record contains at minimum: merchant identifier, timestamp; amount field present (may be null if not detectable)		Pass / Fail
TC025	Validate that the extension does NOT record a purchase event on a non-confirmation page	Extension installed; no prior purchase events in storage	1. Open extension/test-pages/checkout-sample.html (not a confirmation page) 2. Wait 5 seconds 3. Inspect <code>chrome.storage.local</code> for purchase records	No new purchase record is created; storage state unchanged from baseline		Pass / Fail

Section 7 — Dashboard & UI

ID	Description	Preconditions	Steps	Expected Results	Actual Results	Status
TC026	Validate that the dashboard loads and displays the card library summary	Onboarding completed; at least one card in wallet	1. Click the OnPoint extension icon in Chrome 2. Navigate to the Dashboard view 3. Observe the card summary section	Dashboard loads without errors; card count and card names from the wallet are displayed		Pass / Fail

ID	Description	Preconditions	Steps	Expected Results	Actual Results	Status
TC027	Validate that the detector status indicator on the dashboard reflects the current detection state	Dashboard is open; extension active	1. Open dashboard on a non-checkout page — note status 2. Open a checkout page in another tab 3. Switch back to the dashboard and observe status	Status changes from "Idle" to "Checkout Detected" (or equivalent) when a checkout tab is active		Pass / Fail
TC028	Validate that the User Profile page displays stored user preferences	Onboarding completed; profile data present	1. Click the OnPoint extension icon 2. Navigate to User Profile 3. Review displayed information	User Profile page loads and displays any stored preferences without errors		Pass / Fail
TC029	Validate that the extension UI renders correctly in light and dark mode (if dark mode is supported)	Extension installed; useDarkMode hook present in codebase	1. Enable dark mode in Chrome (Settings → Appearance) 2. Open the OnPoint popup 3. Observe all UI elements: text, buttons, backgrounds	All UI elements are readable and contrast-compliant in dark mode; no unstyled elements visible		Pass / Fail
TC030	Validate that the extension UI displays correctly when no cards have been added to the wallet	Extension installed; card wallet is empty	1. Remove all cards from the wallet (or install fresh) 2. Open a checkout page 3. Observe the popup/recommendation UI	An empty-state message is displayed (e.g., "Add a card to get recommendations"); no crashes or blank screens		Pass / Fail

Test Environment: Chrome / Chromium (desktop) with OnPoint extension loaded as an unpacked extension. Backend API optional — card/merchant data may be seeded from `database/cards.json` and `database/merchants.json`. |
Out of Scope for MVP UAT: User accounts / login, push notifications, ML recommendations, Firefox / Safari, mobile responsive design.
